

I've managed to setup Notifiarr that is working great. I normally wouldn't write a guide but watching the videos online will cost you a couple days of your life. I'm going to make it very simple. I don't have all the answers. I'm not saying this is the BEST method (I'm still wondering about the docker setup for data) but I managed to get it up and going when other's couldn't. This will make is very simple because I'm going to save you from watching 4 different videos where you're constantly backtracking to go through multiple other installs and setups to do something simple.

-----THIS GUIDE ASSUMES YOU HAVE SONARR, RADARR, and SABnzbd setup and also completely lack any skills related to computer programing-----

--**What is Notifierr?** Notifierr, to me, allows you to integrate the outside world with your services in your unRaid server. It's not specifically for unRaid. I'm sure there's an endless amount of things it can do but I'm using to handle my media libraries. [Trash-Guides](#) is a phenomenal resource for configuring sonarr and radarr (and others) to greatly enhance their capabilities. By using the CFs (custom formats) you can copy and paste them into radarr to get the media you want. In this use case Notifierr automates those functions. You can simply click everything you want and Notifierr will automatically import those settings into radarr for you THEN monitor Trash for any changes he makes. This will mean your library will constantly have the best media to your taste. You can always easily edit things (like you might want 3D or different audio based on your setup) but your library will constantly be kept up-to-date with the best content.

---Time Required = about 20min

--What you need? (Skip everything else in the video guides it's hours and hours of waste for something you'll set and forget)

Discord

Notepad or Notepad++

Ability to port forward or have a reverse proxy setup

--Setting up--

1) go to [Notifiarr.com](https://notifiarr.com) and setup an account. You can use your email or use discord. I decided to create my own account using Free Signup below.

LOGIN

YOUR EMAIL

PASSWORD

Login via Notifiarr

- OR -

 Login via Discord

Forgot password? [Reset it](#)
Don't have an account? [Free Signup](#)
Need help?  [Discord](#)

NOTICE: This service **does not** upload/download anything from anywhere. It handles information sent from applications/scripts and alerts you based on that data.

2) When you register you'll be given an API key. You'll use this API key to connect notifiarr to your server just like you connect Sabnzbd or Prowlarr to Sonarr and Radarr. Don't worry you can always find it later.

Register

Already Have Account? [Signin](#)

Note: If you want to sign in via Discord in the future, use the same email address as you use for Discord.

3) You'll be greeted with this page. In the middle click the Verify and get Server list. If you're like me and rarely ever used discord then you probably have no idea what's going on. Follow the prompts and let it setup a discord server. You have to have discord installed, not just the web version for this. Just keep clicking your way through. You'll never really need to do anything with it again.

4) Download the Notifiarr docker

5) Go back to your Notifiarr website and click on the picture icon in the top left. You'll see that brings up your profile where you can see your api key. Copy that key and place it in the settings of the Notifiarr docker container.

Update Container

Name: Notifiarr

Overview: Official Notifiarr Client. This application provides the gateway for media requests to your starr application. <https://Notifiarr.com>

Additional Requirements: None Listed

Repository: golift/notifiarr

Network Type: Custom : unraid

Fixed IP address (optional): Subnet: 172.18.0.0/16

Console shell command: Bash

Privileged: ON

Notifiarr API Key: [REDACTED] EDIT REMOVE
Container Variable: DN_API_KEY

Plex Token: [REDACTED] EDIT REMOVE
Container Variable: DN_PLEX_TOKEN

Plex URL: http://192.168.72.117:32400/ EDIT REMOVE
Container Variable: DN_PLEX_URL

WebPort: 5454 EDIT REMOVE
Container Port: 5454

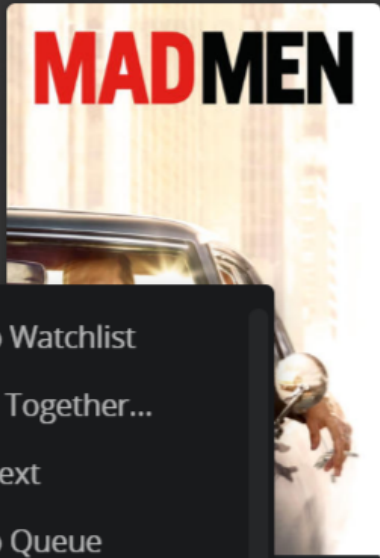

Show more settings ...
Show docker allocations ...
Add another Path, Port, Variable, Label or Device

APPLY DONE

If you want your plex token you find it by opening plex. Clicking on the three dots to the bottom right of any title. Click on GET INFO. Click on VIEW XML. Don't panic then scroll to the very end of the address bar. You'll see Plex-Token=. Copy and paste everything after the = sign.

I'll admit this might be a pert that I modify once I figure out more about it. I'm not sure why it has Storage Disk 1 to /mnt/disk1. It says add more to report storage usage. I'm thinking for my use this is a dead button I could probably remove.

Storage Disk 1:	<code>/mnt/disk1</code>	EDIT	REMOVE
	Container Path: <code>/storage/1</code> Set this and add more disks to report storage usage.		
appdata: *	<code>/mnt/cache/appdata/Notifiarr</code>	EDIT	REMOVE
	Container Path: <code>/config</code>		

6) Moving on. Select APPLY on your docker and let it install. Once it is up and running stop the docker. Go through your shares and find your appdata folder for the docker. You'll be modifying the notifiarr.conf file

7) You can make this as easy or hard on yourself as you'd like. The video guides have you going through multiple difficult guides to setup other programs. I spent hours trying then realized I could just use Notepad and be done in 2 minutes. On your unraid server open Radarr, Sonarr, SabNzbd, and Plex. (you might as well). Then go to the notifiarr.conf file and open it with notepad. Copy and paste the SAME API from notifiarr.com into the file if it's not there. I spent forever wondering why notifiarr wouldn't work and it's because the generated .conf file from the docker did not import the api key. Put everything INSIDE the quotations. "xxxxxx"

[Discord channel setup](#)

TRASH GUIDES

ON

This integration will keep your Sonarr RPs and Radarr CFs plus scores in sync with TRaSH Guides.

Client required: Yes

WEBSITE STATUS

OFF

This integration will ping a given website and report when it is down, track how much downtime, etc.

Client required: No

11) Now click on **Notifiarr Client Configuration**. This is where the sausage is made. Check your connection. The little LAN icon is either red or green. This is an outside service wanting to contact your unRaid server. So you'll either have forward port 5454 or setup your Reverse Proxy. In my case I went to Cloudflare. Logged in and added a Notifiarr.xxxxx.net CNAME. Saved and closed that. Then went to Nginx Proxy Manager and created a Notifiarr.xxxx.net Proxy. Saved and closed that. Then I went to my address bar and typed in Notifiarr.xxx.net. If you've forwarded your ports or setup your reverse proxy correctly you'll see this.

You're client configurator could show a RED lan icon and you still get this webpage. This means your proxy is configured and able but the outside service is still having an issue connecting to the inside docker. I had this issue and after several rounds in the Notifiarr discord (wasn't all that helpful because none of them use Nginx Reverse proxy manager, cloudflare, or unRaid) I traced it back to the config file above not having imported the API key. If you have the proper API key in the config AND in the docker AND get this notification that notifiarr can access the outside then go back to you Notifiarr.com and click the little LAN icon again. DO NOTE that simply putting in notifiarr.xxxx.net or my IP address did not work. You must put <https://>. There very well could be other ways but that's the only thing it would accept and again I'm Mr "Set and Forget" so I'll hopefully never see it again.

Version: 0.3.1.530
Uptime: 1h 47m
Platform: Docker 5.15.40-Unraid
Last conf change: 5/25/2022 2:29 PM
Last conf sync: 5/25/2022 2:29 PM

Connection

 <https://notifiarr.██████████.net> 

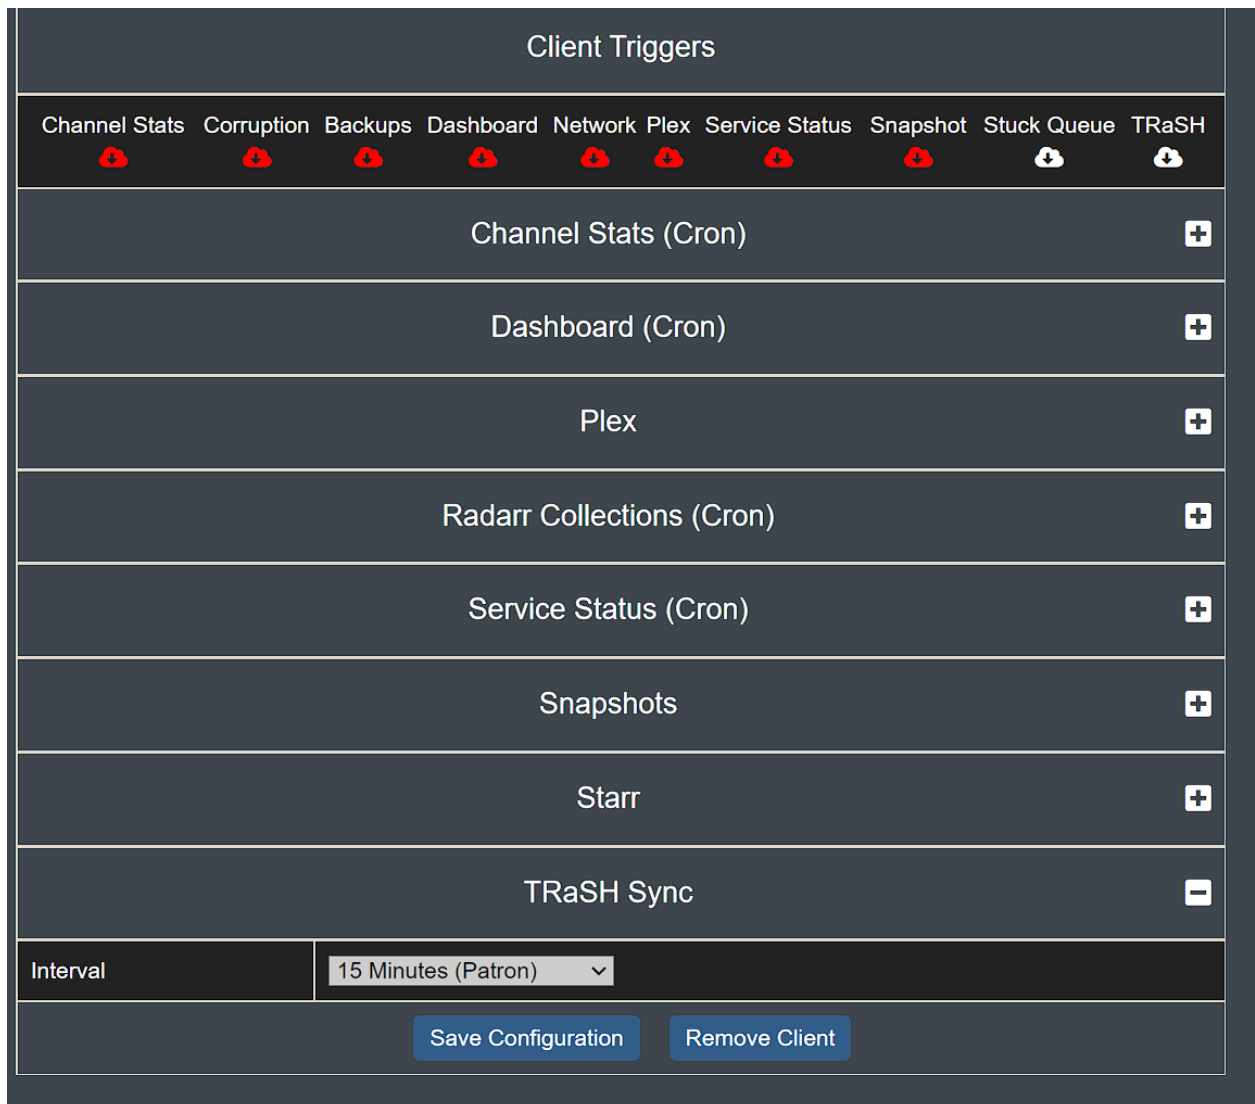

- This is required for things such as Dashboard, Channel stats, TRaSH sync, Plex notifications, Media requests, etc...

[? WIKI](#)

Multiple clients:

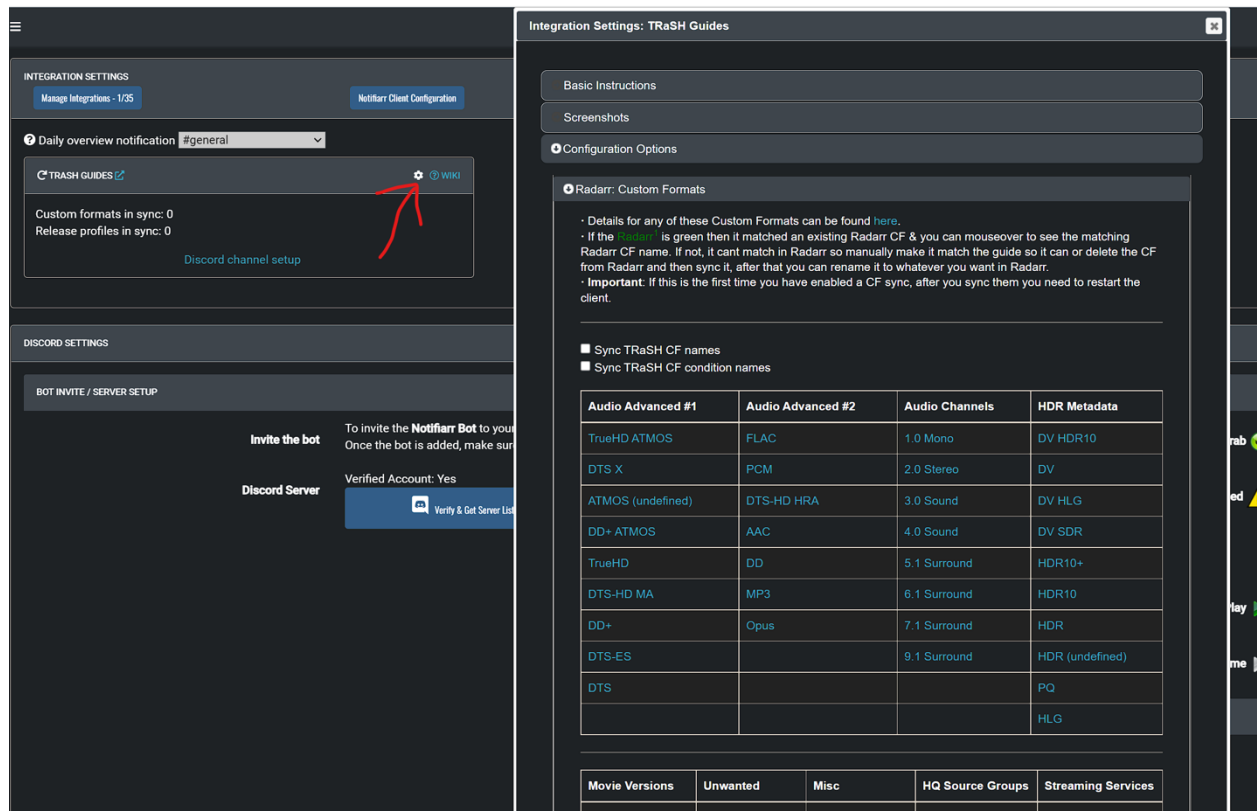

- Only one port forward/client is required for notification purposes
- If you don't want to port forward them, the client will poll every 5 minutes for changes
- You can restart a client at anytime to update settings on demand

12) Ensure your Radarr, Sonarr, etc are all up and running. Scroll further down and at the bottom you'll see Trash Sync. Click the plus and set an interval. I just put 15 min so whenever he updates something it starts going ASAP. After doing that click save. Also notice at the top you should no longer have red clouds for that service. Click the cloud under TRaSH to trigger a request. You should get a green indication on the screen that it was successful. Scroll up and close this window.

13) On the left under the Profile icon click on **Media Requests**. You're not going to do anything here but you'll see Radarr, Sonarr, Lidarr all in the middle doing an update then say waiting. You just need to do this step so things start talking to each other.

14) Click back on **Integration Setup** on the left. You should see TRash Guides under the two buttons we clicked earlier. Click the settings icon on the right. I don't know why it's so small. If things were setup correctly you'll see a +Configurations Options. Click that and if you did the Media Requests pages above and connected everything with the right API keys and IPs you should see Radarr and Sonarr listed. Click Radar. That's the moneyshot. Now you'll be greeted with a page of large dropdown menus that will blow your mind.

BEFORE YOU START CLICKING ON ANYTHING HERE: If you've ever used Trash's custom formats then you need to go back into Radarr and Sonarr and remove everything first. Trash told me this on discord earlier himself. Radarr>Settings>Custom Formats... get to deleting. Sonarr>Settings>Profiles>Release Profiles... get to deleting.

15) Go back to [Notifiarr.com](https://notifiarr.com) and on the Integrations Settings: Trash Guides page select the two boxes of Sync TRaSH CF names and Sync TRaSH CF condition names. This way everything is the same with how Trash keeps things so if he alters something it changes on your end.

Basic Instructions

Screenshots

Configuration Options

Radarr: Custom Formats

- Details for any of these Custom Formats can be found [here](#).
- If the **Radarr** is green then it matched an existing Radarr CF & you can mouseover to see the matching Radarr CF name. If not, it can't match in Radarr so manually make it match the guide so it can or delete from Radarr and then sync it, after that you can rename it to whatever you want in Radarr.
- **Important:** If this is the first time you have enabled a CF sync, after you sync them you need to restart client.

Sync TRaSH CF names

Sync TRaSH CF condition names

Audio Advanced #1	Audio Advanced #2	Audio Channels	HDR Metadata
TrueHD ATMOS	FLAC	1.0 Mono	DV HDR10
DTS X	PCM	2.0 Stereo	DV

16) Now start clicking around and figuring out what you want. You should see these items load into your Radarr. For instance I can't transcode TrueHD on my AppleTV4ks. Normally I wouldn't want them but that could really limit the quality of a release. So instead I'd rather leave that alone, download x265 Dolby Vision or HDR content, then have unmanic go through for me and handle the transcoding to AC3. For my setup I can't tell a difference. Play with the setting and see how they work with Radarr for you.

17) UNWANTED: Scroll down to the bottom and you'll see my favorite part which is what to exclude! No more getting just junk. And frankly I've lacked the ability to do all of this on my own properly. So the great thing is once you select the options they will sync with Trash. If something better comes out and he wants to use it then all the setting transfer to you as well. You can still place limits on things. Remember that you select you want 1080p content so he's not shoving 4k REMUX at you. He's just doing what he thinks are the best settings for that 1080p content. Given that he's been literally writing the book and the code for everything I very much consider him the top dog and would rather have him managing my library than me!

Epilogue: I'm a Forest Gump in the computer/server world. I know what I want to do but I need guides to do them. The problem is the guides as of late seem to be gaining in complexity and are not exactly following the KISS method. I was pretty frustrated getting halfway through

a video only to find out they were now going to use a method relying on another program "Which we have a video tutorial on that should checkout!!!" Which then led to another install video because that relied on something else from before. Then there's a lot of opinions on how "You could do it this way OR do it this way". If you're like me, that drives you crazy. Just tell me what to do so I can put this nightmare of my life behind me. I'm not looking for clicks, likes, subscribers, anything to do with joining a discord. Just hope you find this useful and save yourself a couple days of hair pulling so you can do something better with that time like drinking. But seriously give this a try **IT'S AWESOME!!!**
